Arlingclose commentary on the External Context for Treasury Management activity

Economic background

The impact on the UK from the government's Autumn Budget, slower expected interest rate cuts, a short-term boost to but modestly weaker economic growth over the medium term, together with the impact from President-elect Trump's second term in office and uncertainties around US domestic and foreign policy, will be major influences on the Authority's treasury management strategy for 2025/26.

The Bank of England's (BoE) Monetary Policy Committee (MPC) held Bank Rate at 4.75% at its December 2024 meeting, having reduced it to that level in November and following a previous 25bp cut from the 5.25% peak at the August MPC meeting. At the December meeting, six Committee members voted to maintain Bank Rate at 4.75% while three members preferred to reduce it to 4.50%.

The November quarterly Monetary Policy Report (MPR) expected Gross Domestic Product (GDP) growth to pick up to around 1.75% (four-quarter GDP) in the early period of the BoE's forecast horizon before falling back. The impact from the Budget pushes GDP higher in 2025 than was expected in the previous MPR, before becoming weaker. Current GDP growth was shown to be zero (0.0%) between July and September 2024 and 0.4% between April and June 2024, a further downward revision from the 0.5% rate previously reported by the Office for National Statistics (ONS).

ONS figures reported the annual Consumer Price Index (CPI) inflation rate at 2.6% in November 2024, up from 2.3% in the previous month and in line with expectations. Core CPI also rose, but by more than expected, to 3.6% against a forecast of 3.5% and 3.3% in the previous month. The outlook for CPI inflation in the November MPR showed it rising above the MPC's 2% target from 2024 into 2025 and reaching around 2.75% by the middle of calendar 2025. This represents a modest near-term increase due to the ongoing impacts from higher interest rates, the Autumn Budget, and a projected margin of economic slack. Over the medium-term, once these pressures ease, inflation is expected to stabilise around the 2% target.

The labour market appears to be easing slowly, but the data still require treating with some caution. The latest figures reported the unemployment rate rose to 4.3% in the three months to October 2024 and economic inactivity fell to 21.7%. Pay growth for the same period was reported at 5.2% for both regular earnings (excluding bonuses) and for total earnings. Looking ahead, the BoE MPR showed the unemployment rate is expected to increase modestly, rising to around 4.5%, the assumed medium-term equilibrium unemployment rate, by the end of the forecast horizon.

The US Federal Reserve has continued cutting interest rates, bringing down the Fed Funds Rate by 0.25% at its December 2024 monetary policy meeting to a range of 4.25%-4.50%, marking the third consecutive reduction. Further interest rate cuts are expected, but uncertainties around the potential inflationary impact of incoming President Trump's policies may muddy the waters in terms of the pace and magnitude of further rate reductions. Moreover, the US economy continues to expand at a decent pace, rising at an (upwardly revised) annual rate of 3.1% in the third quarter of 2024, and inflation remains elevated suggesting that monetary policy may need to remain more restrictive in the coming months than had previously been anticipated.

Euro zone inflation rose above the European Central Bank (ECB) 2% target in November 2024, hitting 2.2% as was widely expected and a further increase from 2% in the previous month. Despite the rise, the ECB continued its rate cutting cycle and reduced its three key policy rates by 0.25% in December. Inflation is expected to rise further in the short term, but then fall back towards the 2% target during 2025, with the ECB remaining committed to maintaining rates at levels consistent with bringing inflation to target, but without suggesting a specific path.

Credit outlook

Credit Default Swap (CDS) prices have typically followed a general trend downwards during 2024, reflecting a relatively more stable financial period compared to the previous year. Improved credit conditions in 2024 have also led to greater convergence in CDS prices between ringfenced (retail) and non-ringfenced (investment) banking entities again.

Higher interest rates can lead to a deterioration in banks' asset quality through increased loan defaults and volatility in the value of capital investments. Fortunately, the rapid interest rate hikes during this monetary tightening cycle, while putting some strain on households and corporate borrowers, has not caused a rise in defaults, and banks have fared better than expected to date, buoyed by strong capital positions. Low unemployment and robust wage growth have also limited the number of problem loans, all of which are positive in terms of creditworthiness.

Moreover, while a potential easing of US financial regulations under a Donald Trump Presidency may aid their banks' competitiveness compared to institutions in the UK and other regions, it is unlikely there will be any material impact on the underlying creditworthiness of the institutions on the counterparty list maintained by Arlingclose, the authority's treasury adviser.

Overall, the institutions on our adviser Arlingclose's counterparty list remain well-capitalised and their counterparty advice on both recommended institutions and maximum duration remain under constant review and will continue to reflect economic conditions and the credit outlook.

Interest rate forecast (December 2024)

Arlingclose expects the Bank of England's MPC will continue reducing Bank Rate through 2025, taking it to around 3.75% by the end of the 2025/26 financial year. The effect from the Autumn Budget on economic growth and inflation has reduced previous expectations in terms of the pace of rate cuts as well as pushing up the rate at the end of the loosening cycle.

Arlingclose expects long-term gilt yields to remain broadly at current levels on average (amid continued volatility), but to end the forecast period modestly lower compared to now. Yields will continue remain relatively higher than in the past, due to quantitative tightening and significant bond supply. As ever, there will be short-term volatility due to economic and (geo)political uncertainty and events.
